~~**DIVERSIFICATION**~~

DIVERSIFICATION?

Mean-Variance portfolio (Markowitz, 1952)

- M stocks:
  - average returns μ_i
  - return variances V_i
  - return correlations C_{ij} (matrix $M \times M$)

Mean-Variance portfolio (Markowitz, 1952)

- M stocks:
  - average returns μ_i
  - return variances V_i
  - return correlations C_{ij} (matrix $M \times M$)
- ***our portfolio:*** fractions of wealth f_i invested in individual stocks

$$\text{portfolio return:} \quad R_P = \sum_{i=1}^{M} f_i \mu_i$$

$$\text{portfolio variance:} \quad V_P = \sum_{i,j=1}^{M} f_i f_j C_{ij} \sqrt{V_i V_j}$$

Mean-Variance portfolio (Markowitz, 1952)

- M stocks:
  - average returns μ_i
  - return variances V_i
  - return correlations C_{ij} (matrix $M \times M$)
- ***our portfolio:*** fractions of wealth f_i invested in individual stocks

$$\text{portfolio return:} \quad R_P = \sum_{i=1}^{M} f_i \mu_i$$

$$\text{portfolio variance:} \quad V_P = \sum_{i,j=1}^{M} f_i f_j C_{ij} \sqrt{V_i V_j}$$

- ***mean-variance portfolio:*** minimizes V_P for a given R_P

This is the key slide

- the optimal portfolio variance

$$V_P^*(R_P, M, \mathbf{C}) = \dots$$

- let's focus purely on correlations: $\mu_i = \mu$, $V_i = V$

This is the key slide

- the optimal portfolio variance

$$V_P^*(R_P, M, \mathbf{C}) = \dots$$

- let's focus purely on correlations: $\mu_i = \mu$, $V_i = V$
- ***effective portfolio size*** m_{ef}

optimal portfolio constructed from ***M*** correlated assets	$\iff$	optimal portfolio constructed from **???** uncorrelated assets

This is the key slide

- the optimal portfolio variance

$$V_P^*(R_P, M, \mathbf{C}) = \dots$$

- let's focus purely on correlations: $\mu_i = \mu$, $V_i = V$
- ***effective portfolio size*** m_{ef}

optimal portfolio constructed from ***M*** correlated assets	$\Longleftrightarrow$	optimal portfolio constructed from **???** uncorrelated assets

$$V_P^*(R_P, M, \mathbf{C}) = V_P^*(R_P, m_{\text{ef}}, \mathbf{1}) \qquad \Longrightarrow \qquad m_{\text{ef}}$$

Effective portfolio size: properties

$$\boxed{m_{\text{ef}} = \sum_{i,j=1}^{M} \left(\mathbf{C}^{-1}\right)_{ij}}$$

Effective portfolio size: properties

$$m_{\text{ef}} = \sum_{i,j=1}^{M} \left(\mathbf{C}^{-1}\right)_{ij}$$

- no correlations:

$$m_{\text{ef}} = M$$

Effective portfolio size: properties

$$m_{\text{ef}} = \sum_{i,j=1}^{M} \left(\mathbf{C}^{-1}\right)_{ij}$$

- no correlations:

$$m_{\text{ef}} = M$$

- perfect correlations:

$$m_{\text{ef}} = 1$$

Effective portfolio size: properties

$$\boxed{m_{\text{ef}} = \sum_{i,j=1}^{M} \left(\mathbf{C}^{-1}\right)_{ij}}$$

- no correlations:

$$m_{\text{ef}} = M$$

- perfect correlations:

$$m_{\text{ef}} = 1$$

- N groups of stocks with no inter-group correlations:

$$m_{\text{ef}} = m_{\text{ef}}(1) + \cdots + m_{\text{ef}}(N)$$

Effective portfolio size: saturation

- all correlations identical:

$$m_{\text{ef}} = \frac{M}{1 + (M - 1)C}$$

Effective portfolio size: saturation

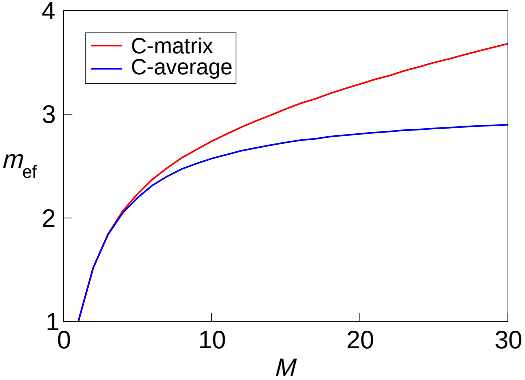
- all correlations identical:

$$m_{\text{ef}} = \frac{M}{1 + (M-1)C} \to \frac{1}{C}$$

Effective portfolio size: saturation

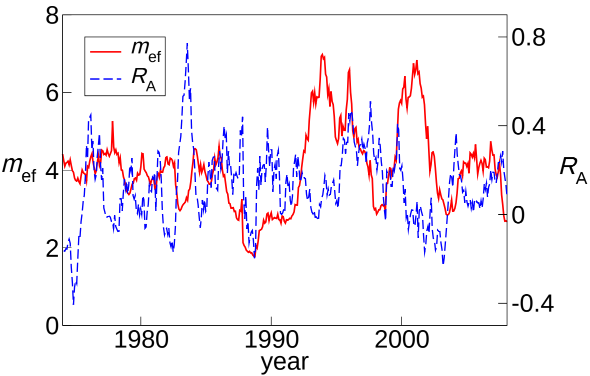
- all correlations identical:

$$m_{\text{ef}} = \frac{M}{1+(M-1)C} \to \frac{1}{C}$$



Effective portfolio size: evolution

20 current stocks from the DJIA (Jan 1973—Apr 2008)



The end
